Report

I attended the short term course on Fundamentals and Applications of Structural Equation Modeling (SEM) organized by Department of Management Studies held at IIT, Roorkee from December 28-29, 2013. It was interdisciplinary course. The following topics such as exploratory factor analysis, confirmatory factor analysis and latent path analysis, regression analysis etc. were covered on two days program. SEM is a technique that combines elements of regression analysis and factor analysis and allows testing of complex casual relationship that is not possible through traditional multivariate approaches. This program served as platform for me to interact with my community people coming from other part of the country.
